You might find helpful an annotated version [0] of Hoare's explanation of JSP that I edited for a Michael Jackson festschrift

; I'd point to these ideas as worth knowing:

ing problem that involves traversing structures can be solved very systematically. HTDP addresses this class, but bases its structure only on input structure; JSP synthesized it.

Comment

- The Profile of the archetypal problems that, however you code, can't be pushed under the rug—most notably structure clashes—and just recognizing them

- Coroutines (or code transformation) let you structure code more cleanly when you need to read or write more than one structure. It's why real iterators (with `yield`), which offer a limited form of this, are (in my view) better than Java-style iterators with a `next` method.

- The idea of viewing a system as a collection of asynchronous processes (Ch. 11 in the JSP book, which later became JSD) with a long-running process for each real-world entity. This was a notable contrast to OOP, and led to a strategy (seeing a resurgence with event storming for DDD) that began with events rather than objects.

[0] <https://groups.csail.mit.edu/sdg/pubs/2009/hoare-jsp-3-29-09...>

▲ ob-nix 63 days ago [-]

... this brings back memories! In the late eighties I, as a teenager, found a Jackson Struct. Pr. book at the town library. I remember I was amazed at the text and wondered why I hadn't heard about the method before.

If I remember correctly did the book clearly point out backtracking as a standard method, while mentioning that most languages lacked that, so it had to be implemented manually.

Session

... with some creative variation

If you want an intro to JSP, in 2009.

For those who don't know :

- There's a class of programs but bases code structure on
- There are some archetypes them helps.
- Coroutines (or code transactional iterators (with yield), which
- The idea of viewing a system for each real-world entity. Events rather than objects.

... this brings back re

amazed at the text and wondered why I hadn't heard about the method before.

If I remember correctly did the book clearly point out backtracking as a standard method, while mentioning that most languages lacked that, so it had to be implemented manually.

“combinational creativity” [Boden]

familiar elements combined in new ways

for HackerNews, things like

a post has a title and either just a link, or just a question

no comments on a post after 2 weeks, no edits after 2 hours

can't downvote a comment until your own post upvoted

...

a Michael Jackson festschrift

ly. HTDP addresses this class,

ishes—and just recognizing

structure. It's why real
od.

) with a long-running process
ning for DDD) that began with

ary. I remember I was

how to add app-specific functionality?

concept Upvote

purpose rank items by popularity

actions

upvote (u: User, i: Item)
downvote (u: User, i: Item)
unvote (u: User, i: Item)

suppose I want this behavior:

you can't downvote an item
until you've received
an upvote on your own post

define a new concept!

a hint: not just used by Upvote

concept Karma

purpose privilege good users

state

karma: User -> one Int

actions

reward (u: User, r: Int)
permit (u: User, r: Int)

concept Post

purpose share content

state

author: Post -> one User
body: Post -> one Text

actions

create (u: User, t: Text): Post
delete (p: Post)
edit (p: Post, t: Text)
get_author (p: Post): User

compose concepts by action synchronization

concept Upvote

actions

upvote (u: User, i: Item)
downvote (u: User, i: Item)
unvote (u: User, i: Item)

when

Upvote.upvote (u, i)
Post.get_author (i) = u'
sync Karma.reward (u', 10)

concept Karma

actions

reward (u: User, r: Int)
permit (u: User, r: Int)

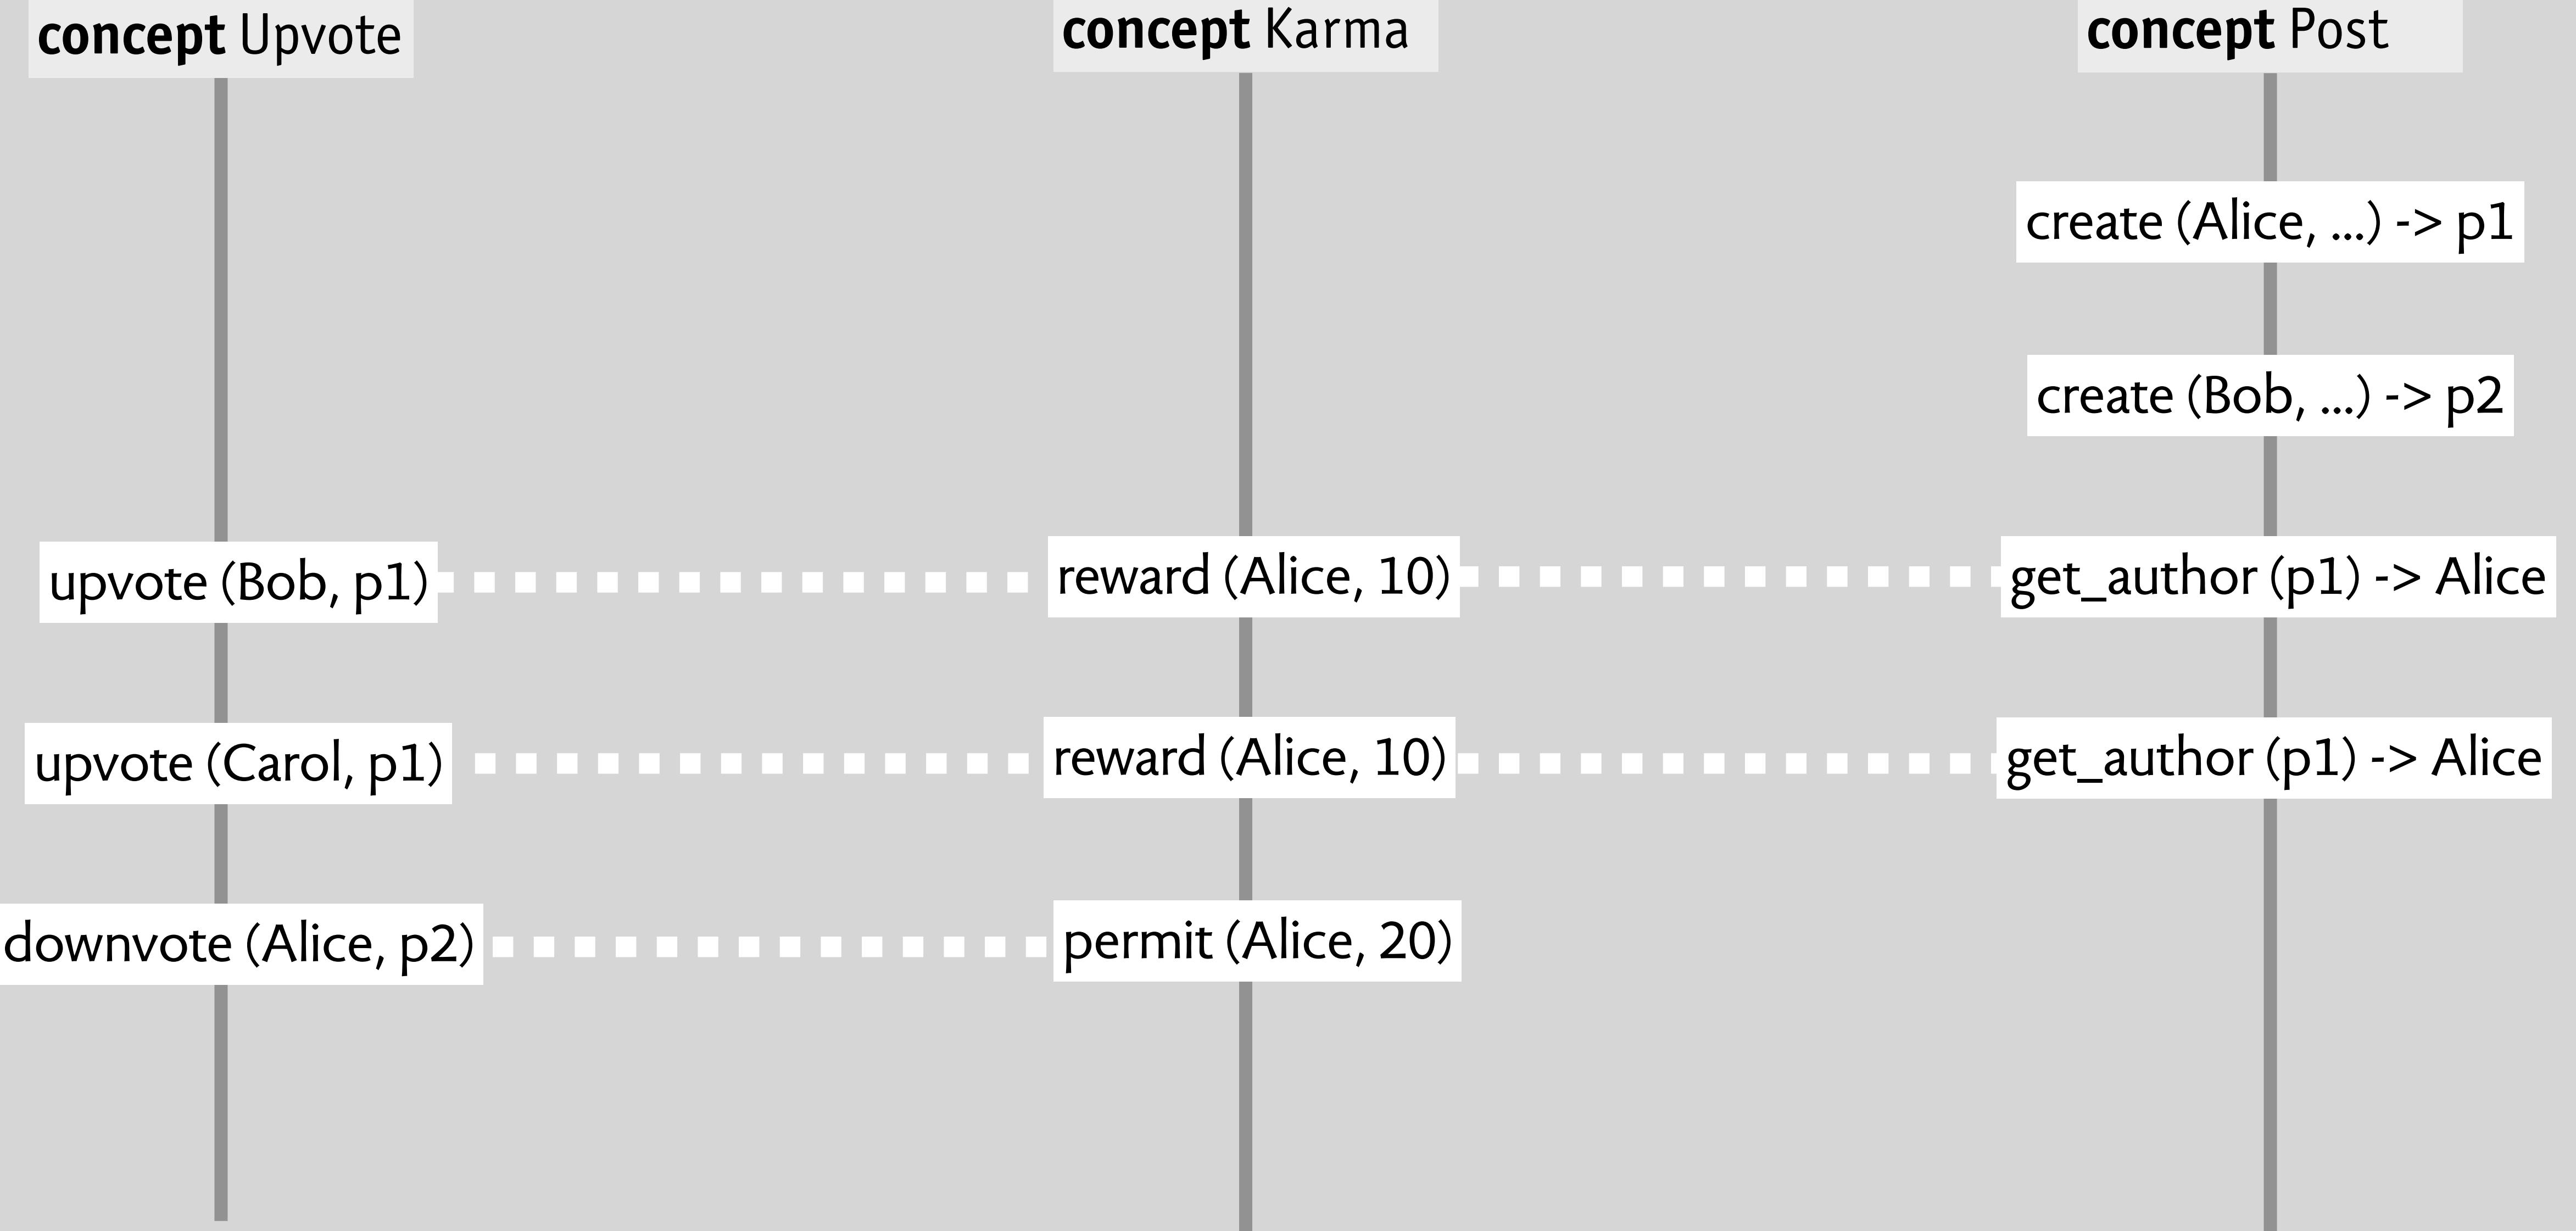

when Upvote.downvote (u, i)
sync Karma.permit (u, 20)

concept Post

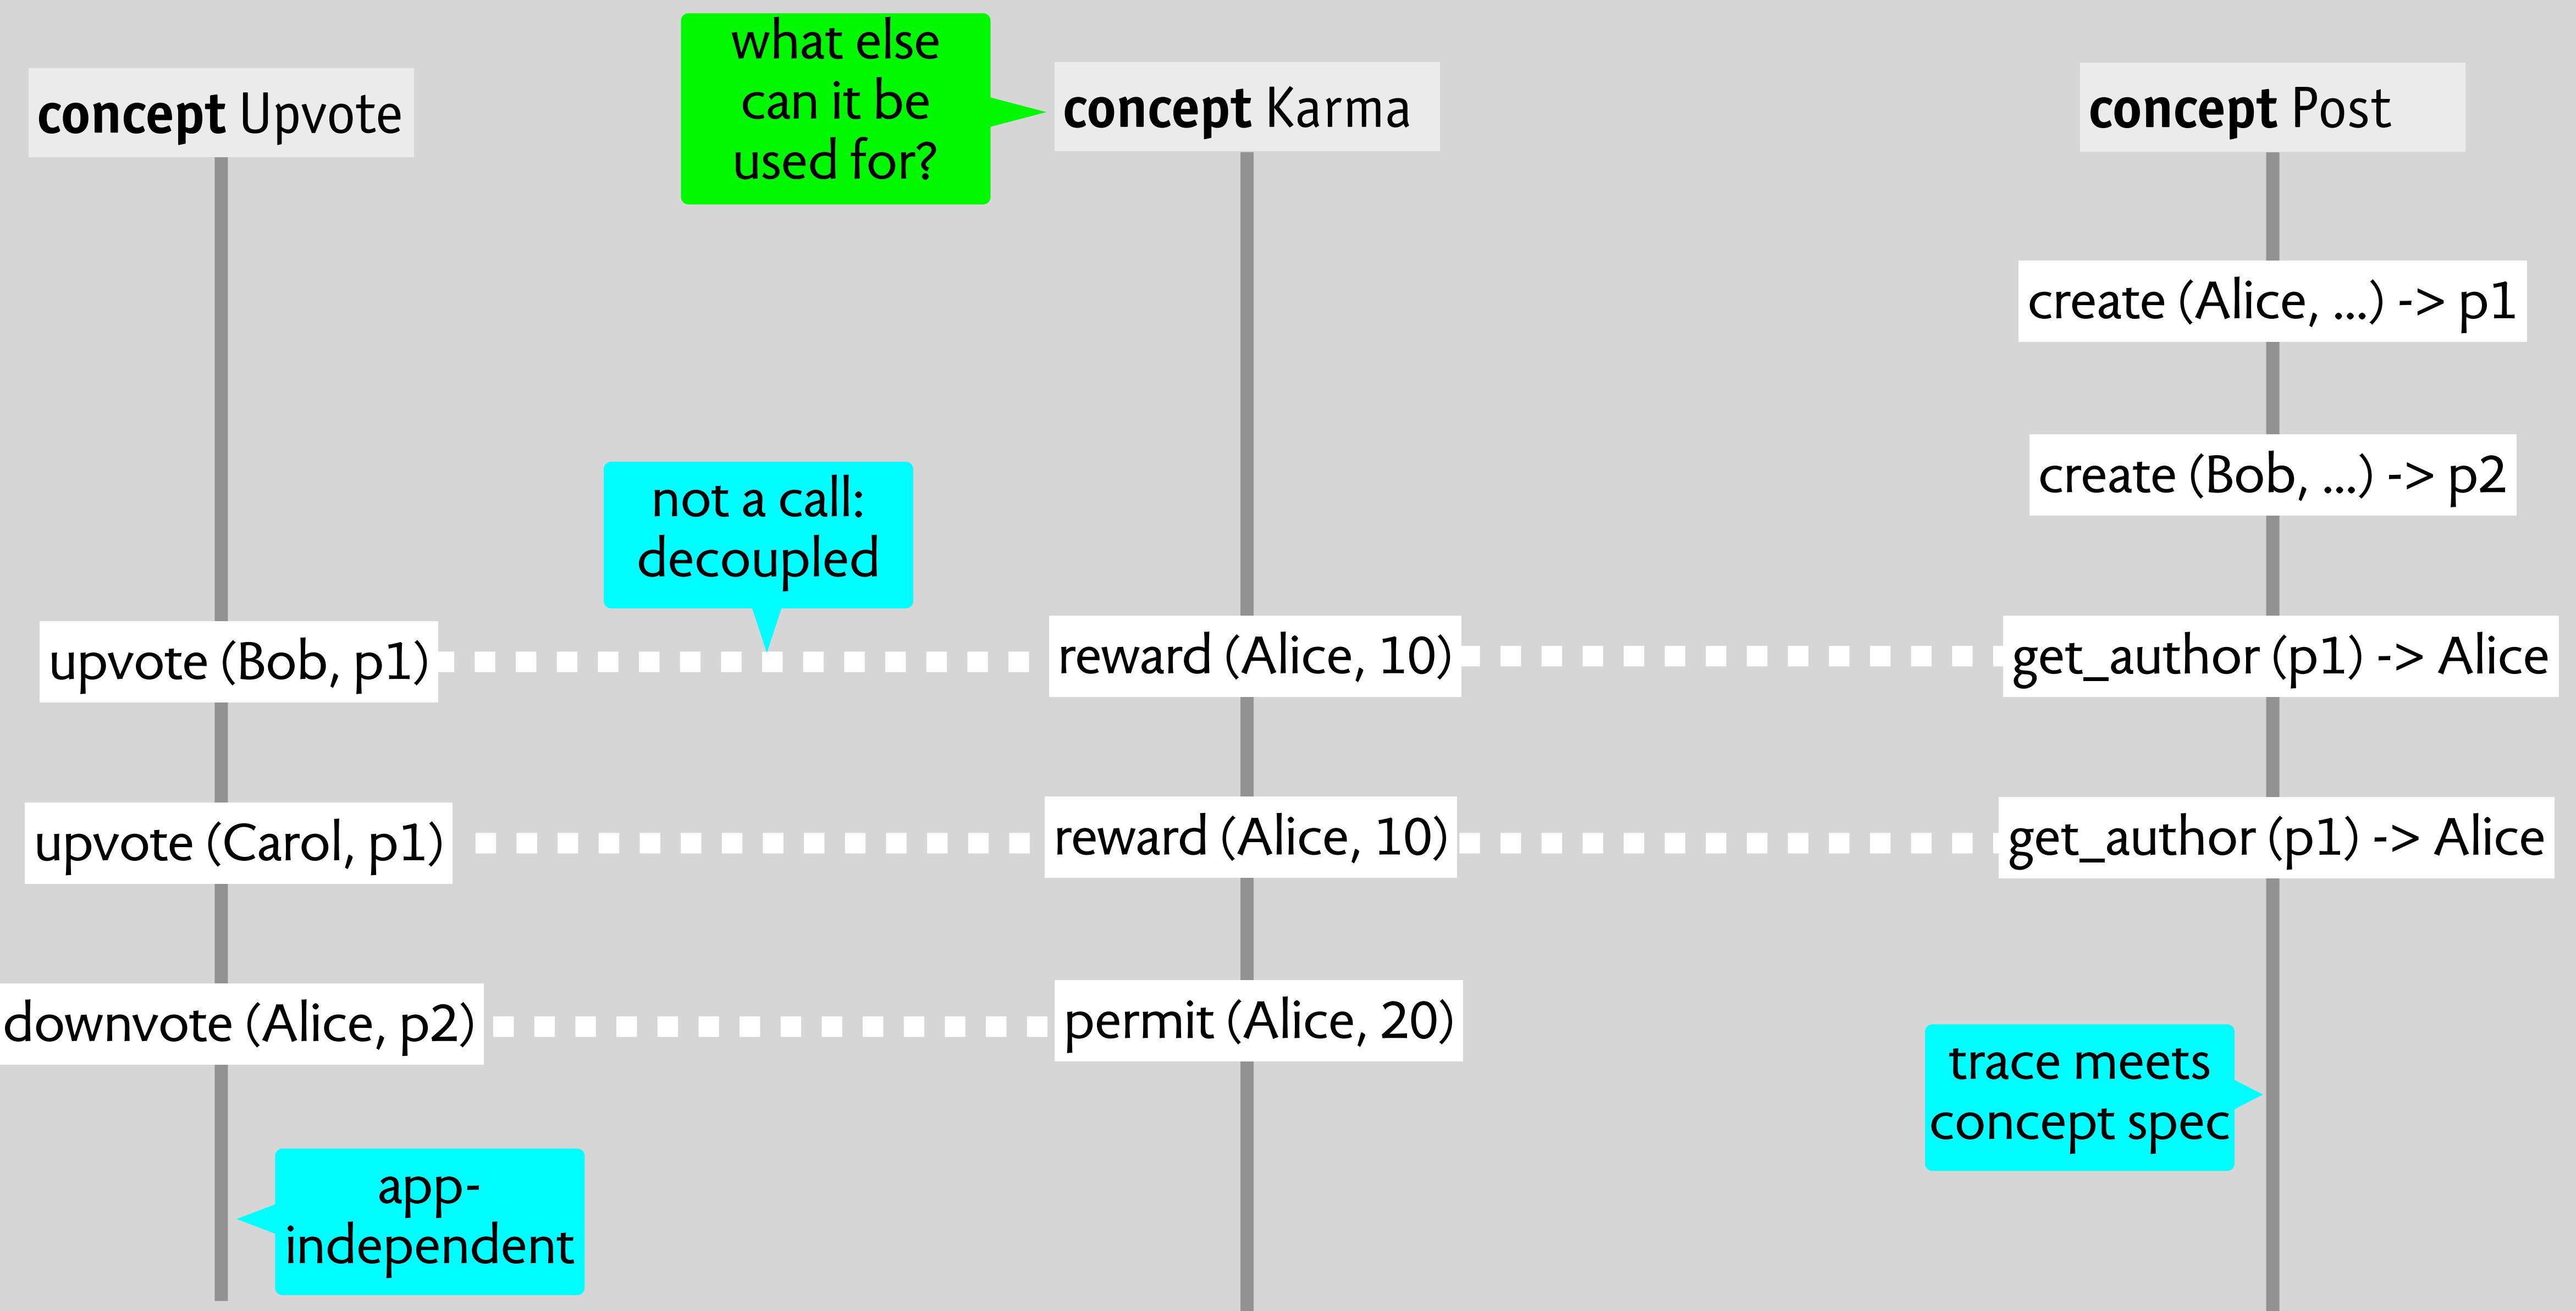

actions

create (u: User, t: Text): Post
delete (p: Post)
edit (p: Post, t: Text)
get_author (p: Post): User

synchronizing concepts

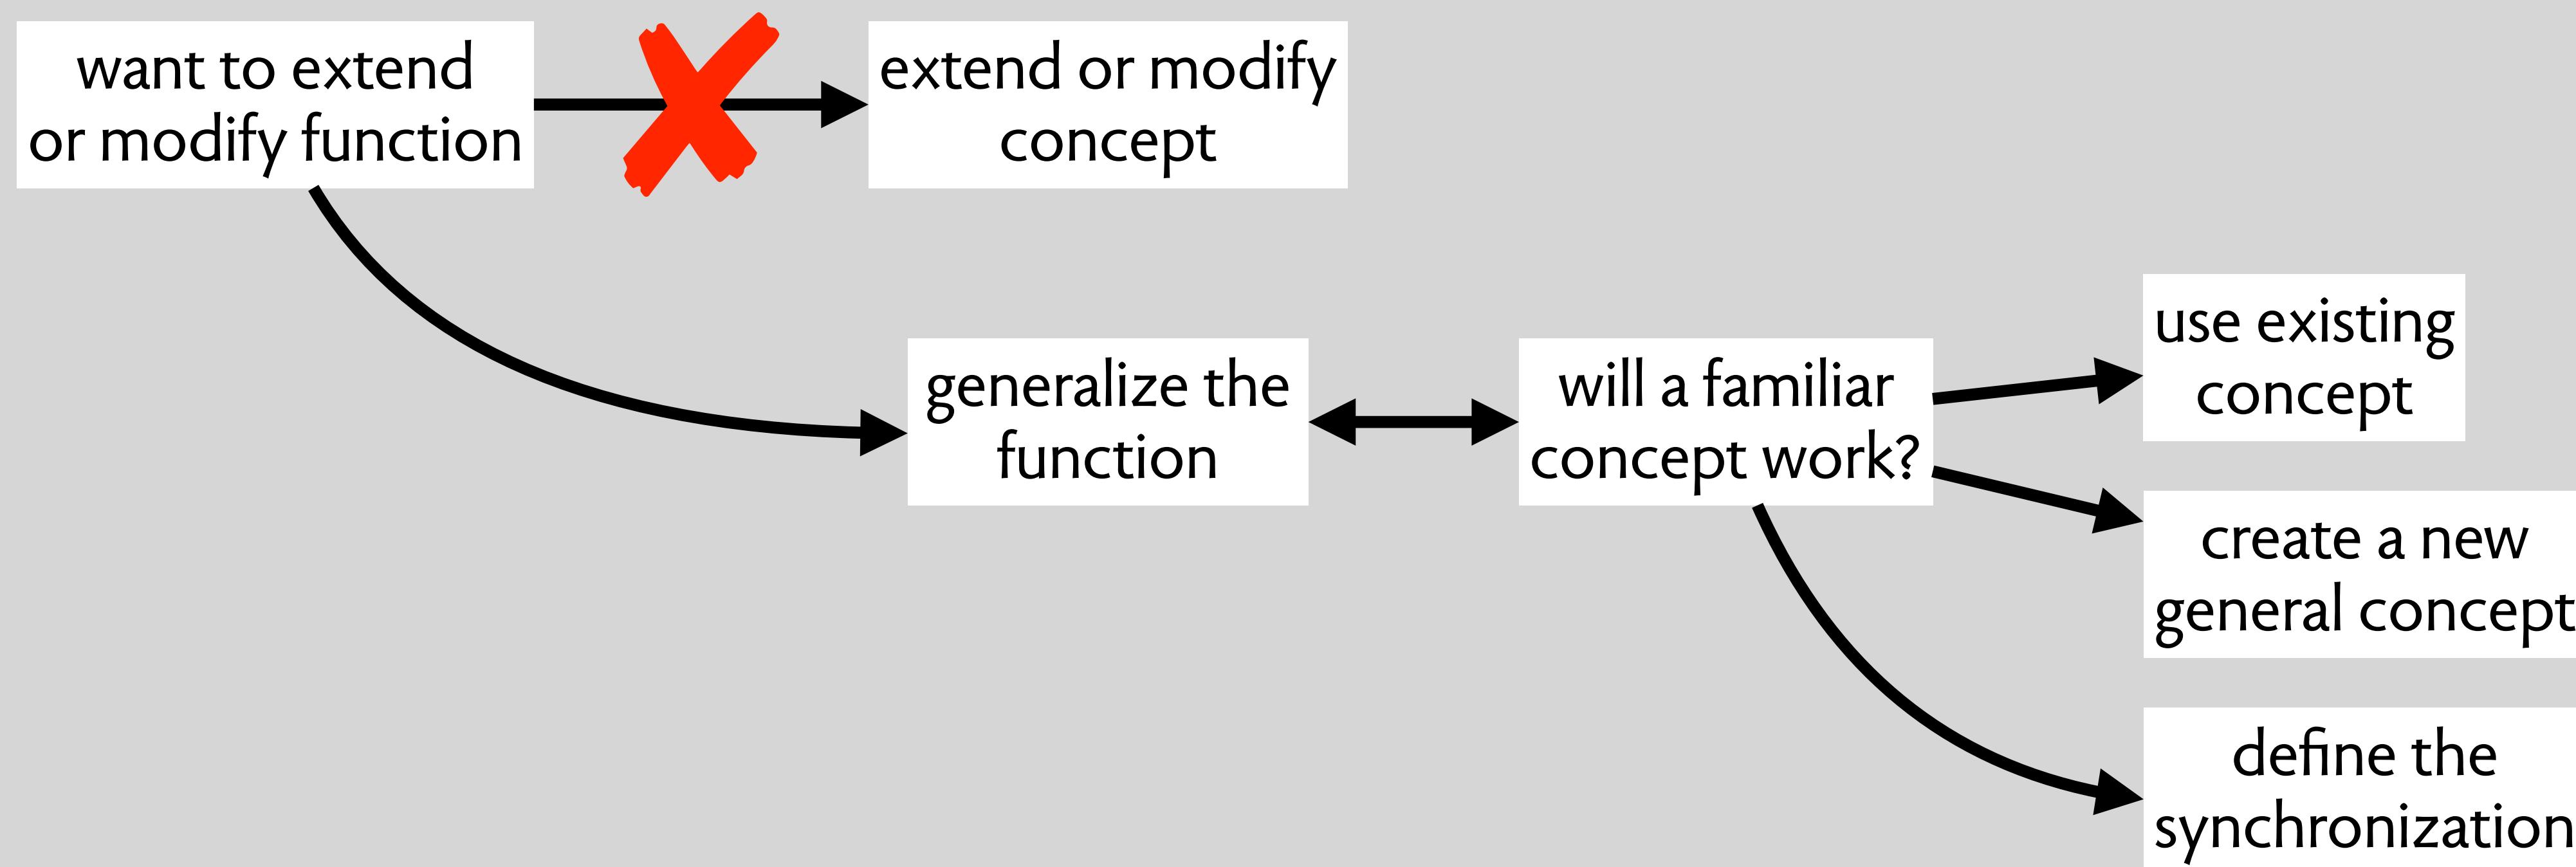

key properties

the
quintessential
software design
move

how to achieve familiarity & decoupling

classification of
emails in Gmail

the challenge

assume we already have

Email Message, Rich Text, Trash concepts
can send and receive formatted messages
and can delete and undelete messages

and now we want to be able to see

messages we've sent
messages we've deleted

how to implement this?

custom buttons to filter on these properties?

a better solution: Labeling

just a label lookup

Inbox

Primary

Alyssa, me 3

hacking meetups javascript - JavaScript makes me feel nostalgic for S

Starred Snoozed Sent Drafts Trash Categories hacking meetups

0 GB (0%) of 15 GB used Manage Terms · Privacy · Program Policies

use sent, trash in filters

label:todo label:trash

1–1 of 1

me, Alyssa

Trash hacking meetups todo javascript - 10:11 am

what other benefits does this design bring?

what's the sync?

concept Trash

purpose allow undeletion

principle if an object is deleted, and the trash is not emptied, it can be restored; if an object is deleted and the trash is emptied, the object is gone but its space is regained

actions

`delete (o: Object)`

`restore (o: Object)`

`empty ()`

concept Labeling

purpose organize items

principle if label is added to an item, then filtering on that label will display that item

actions

`add (l: Label, i: Item)`

`remove (l: Label, i: Item)`

`filter (ls: set Label): set Item`

sync rules

when `Trash.delete(i)` **sync** `Labeling.add ('trashed', i)` **and vv**

when `Trash.restore(i)` **sync** `Labeling.remove ('trashed', i)` **and vv**

multiple owners
for Moira lists

a Moira mailing list

date deleted
in macOS trash

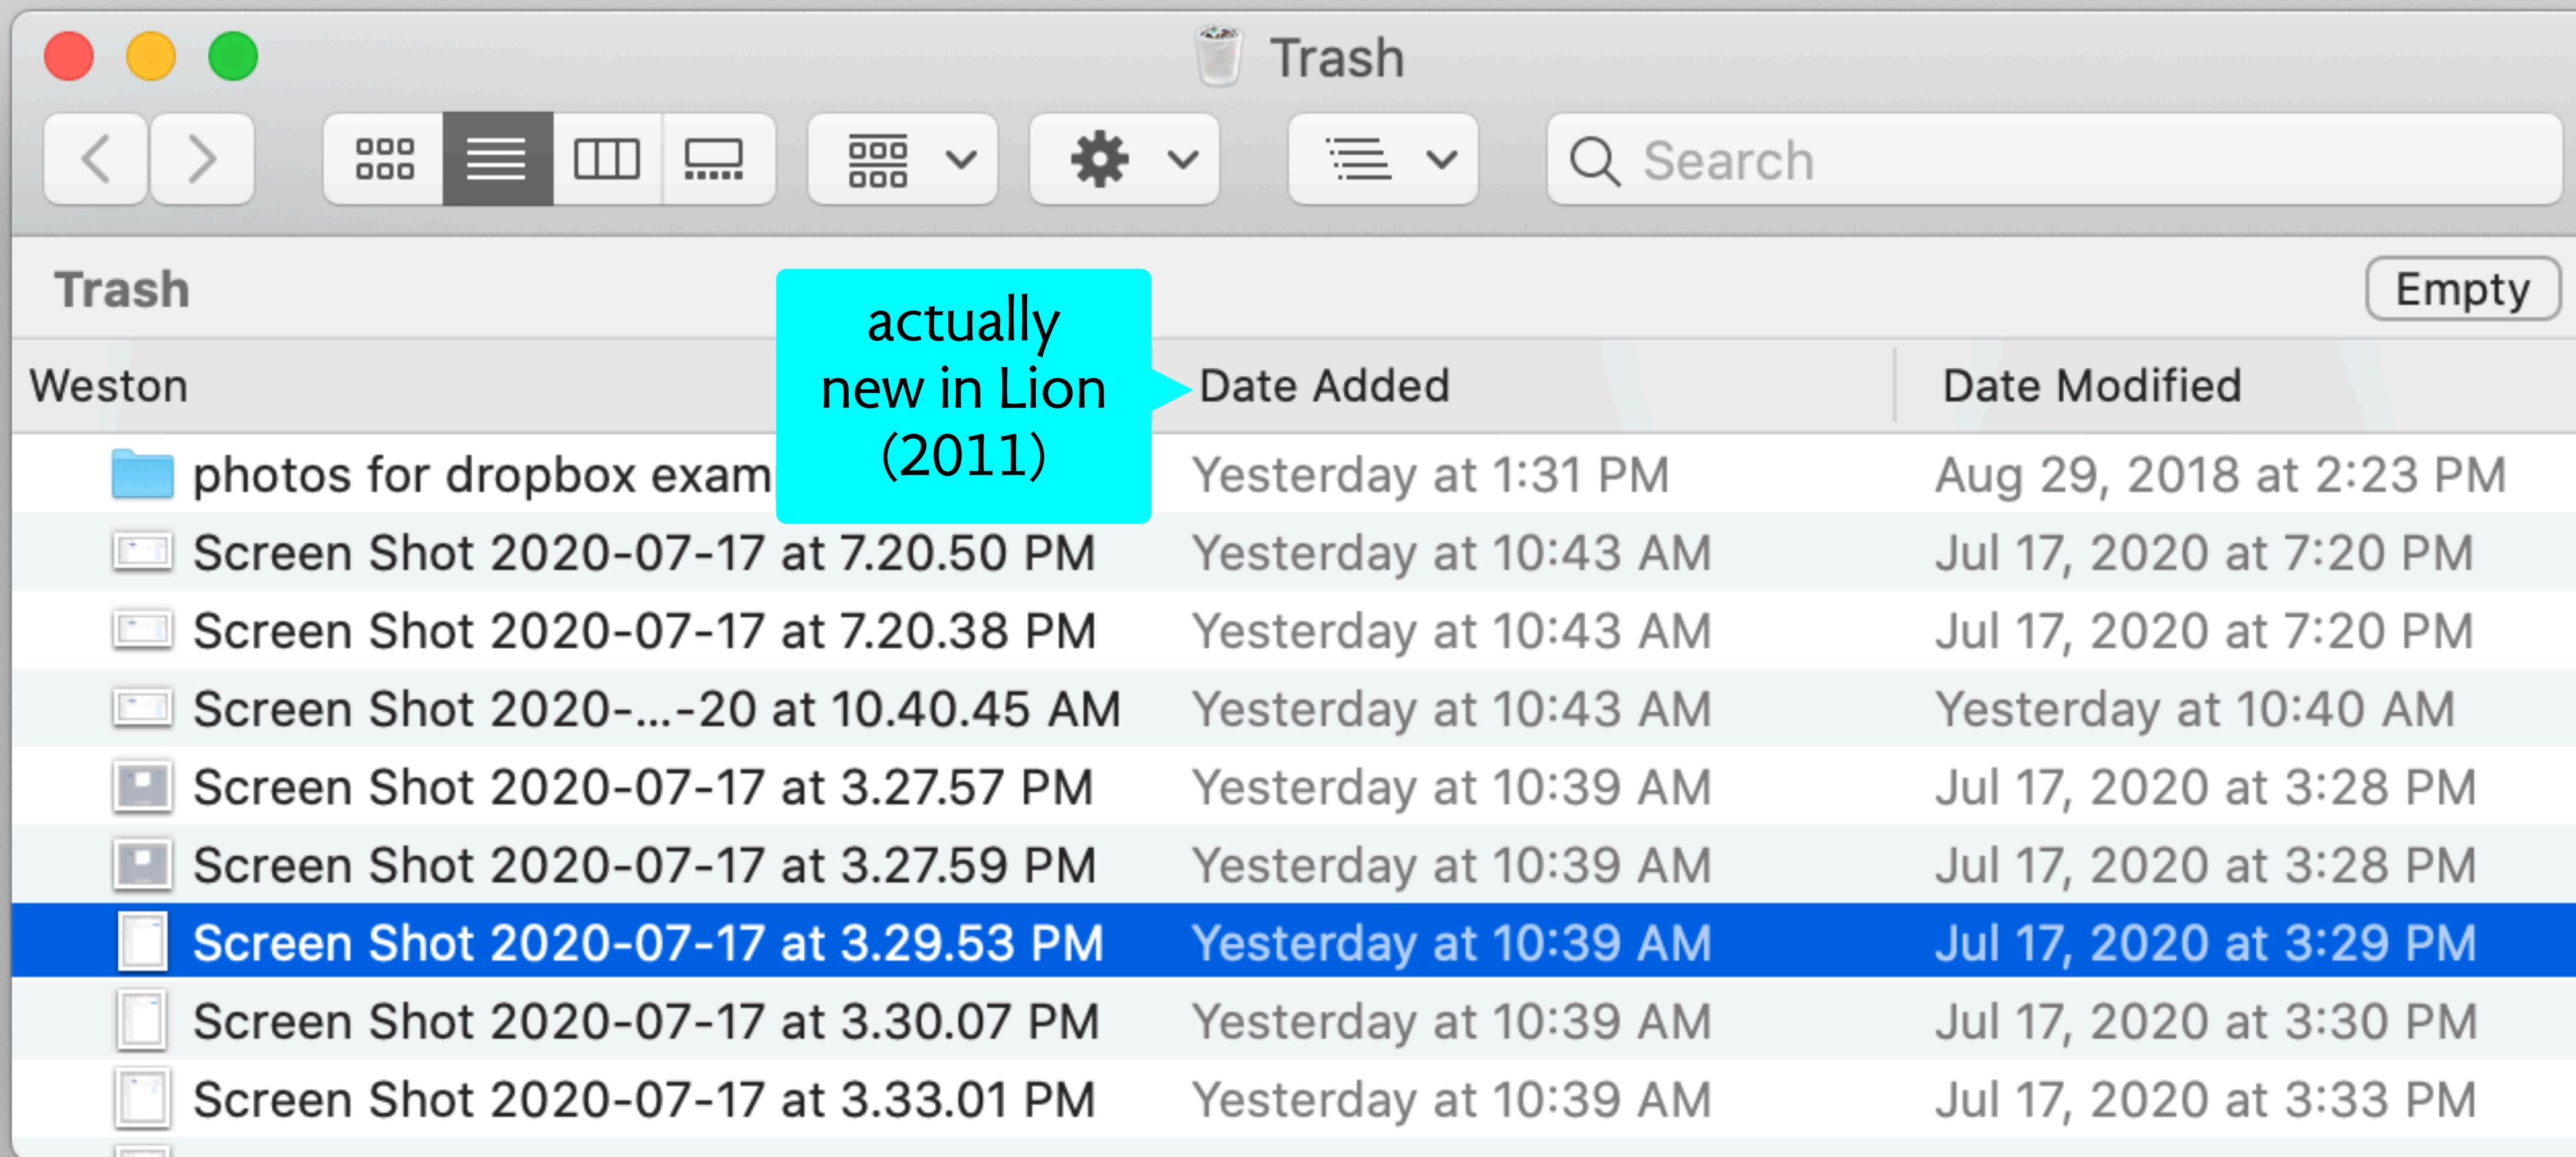

the challenge

assume we already have
a Trash concept
can delete and undelete files
imagine back to early Windows days: deleted files are a special list

and now we want to sort by deletion date
for example, to see file most recently deleted

how to implement this?
add date deleted to trash list?

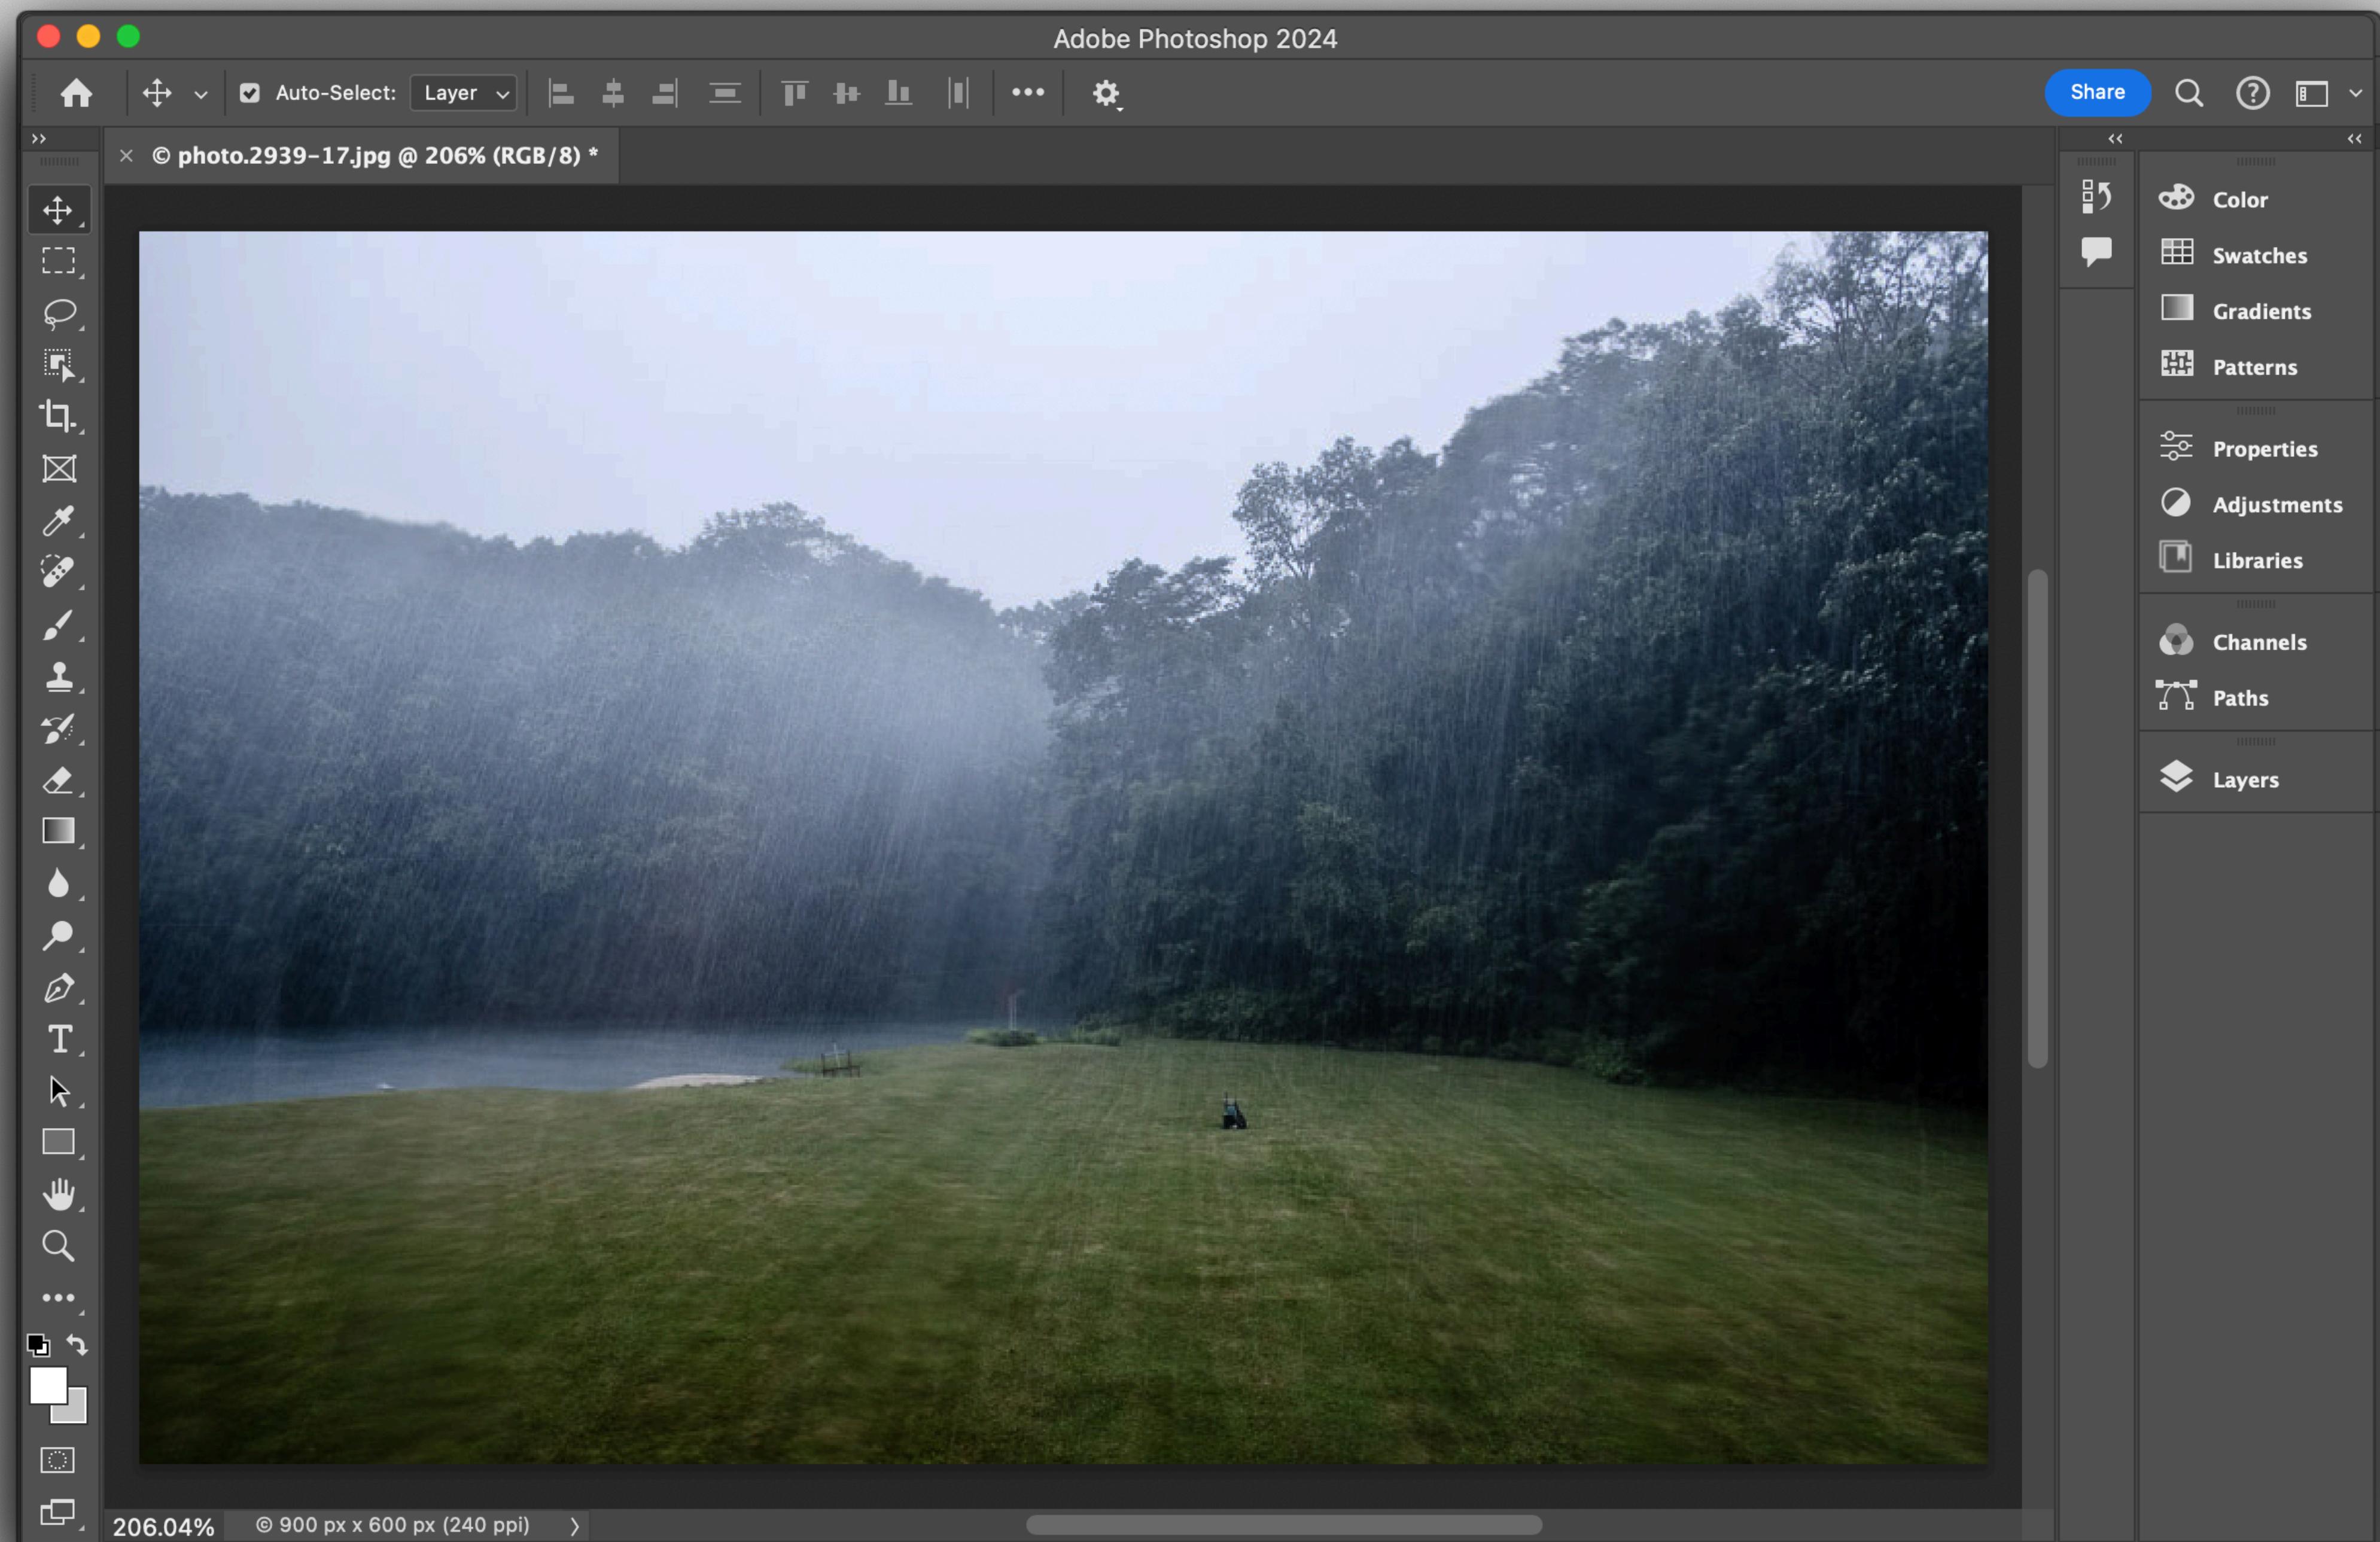

a better solution: make the trash a folder

what other benefits does this design bring?

adding
local adjustments
to Photoshop

how to darken the sky

the challenge and the solution

assume we already have

an Adjustment concept that includes brightness controls

a Selection concept that lets us select pixels for cut and paste

and now we want to apply adjustments locally

for example, to darken just the sky

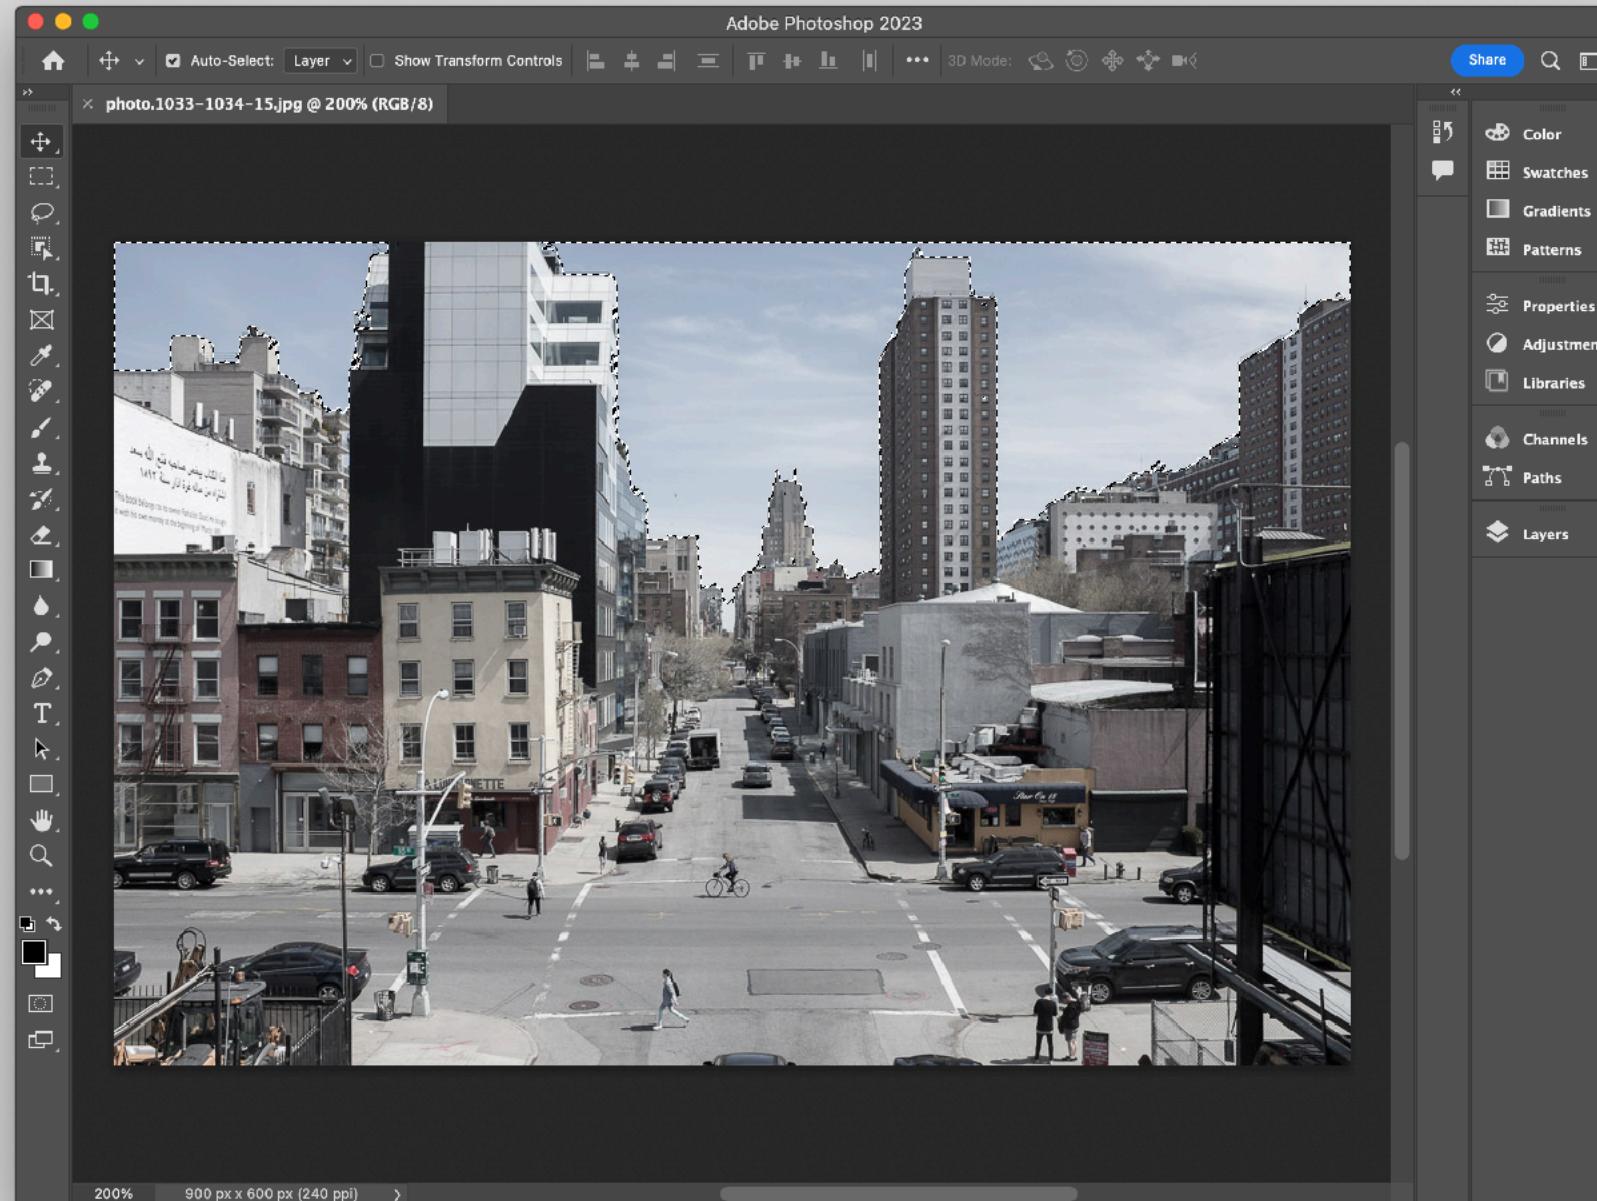

first move

use selection to limit where adjustment is applied

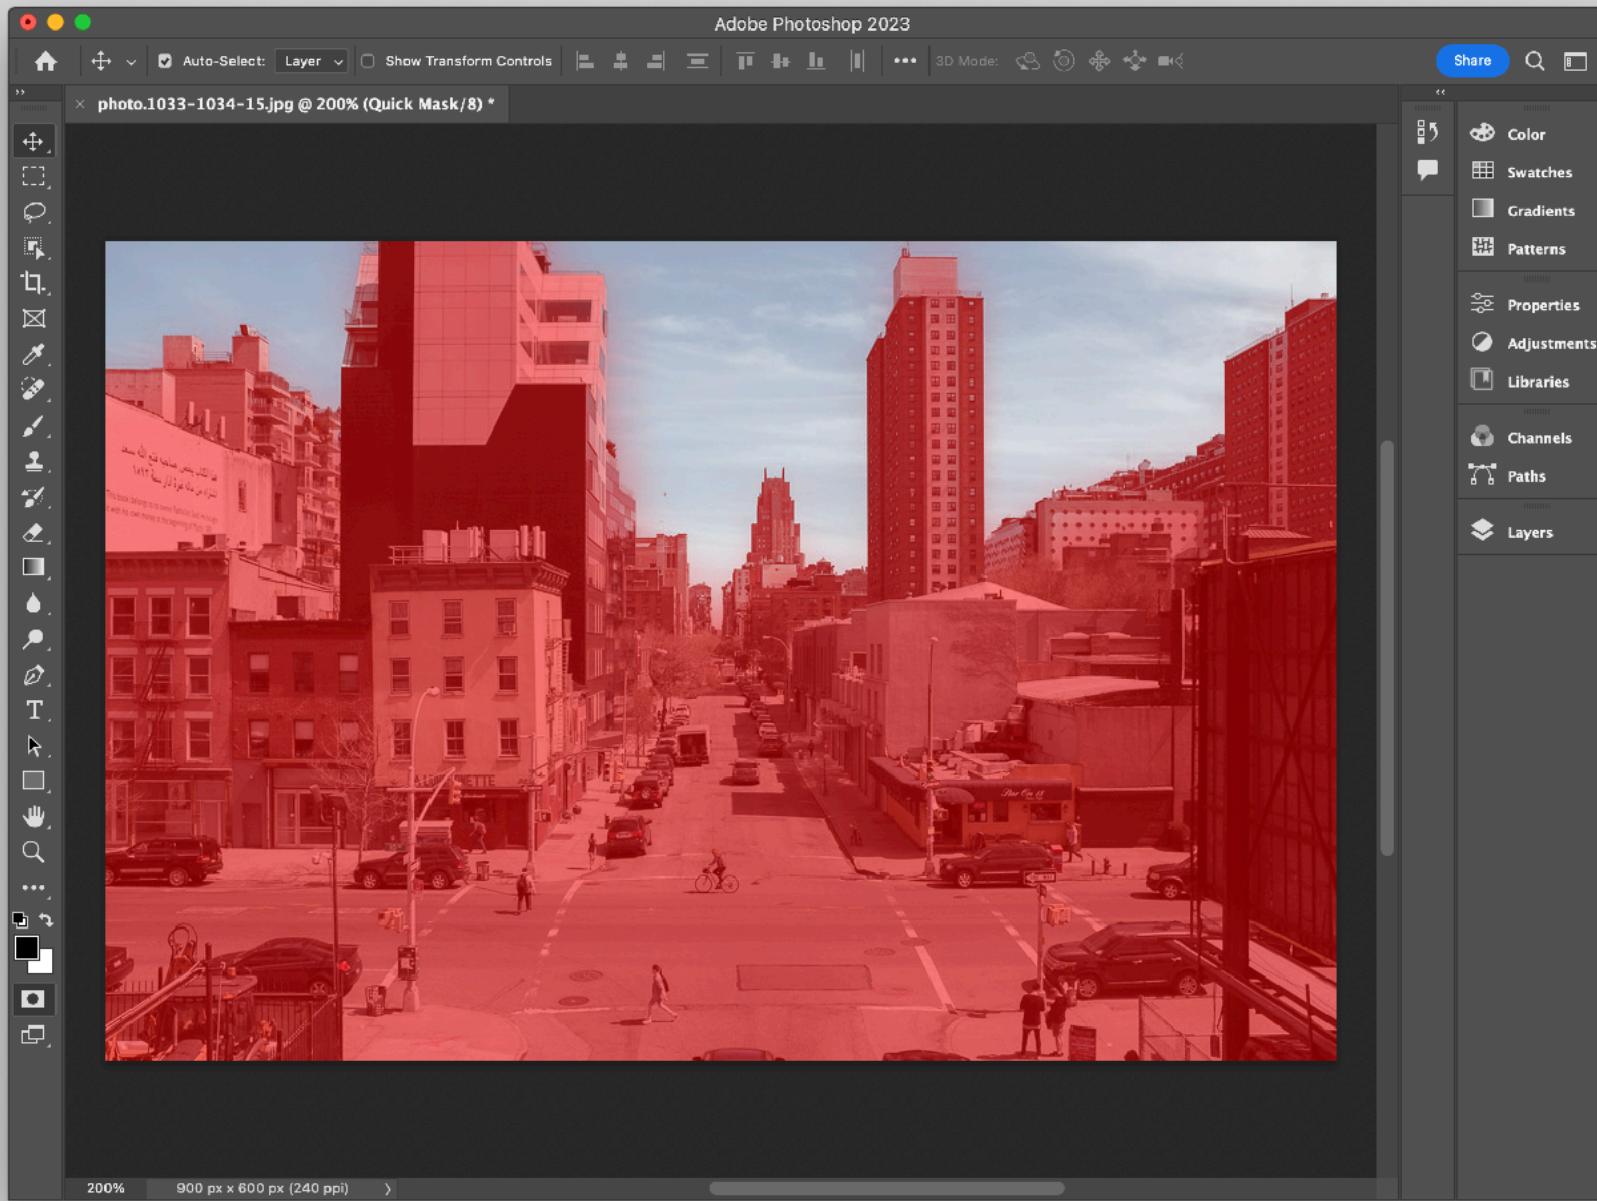

second move

change selection from 0/1 to 0..1, so adjustment can be attenuated

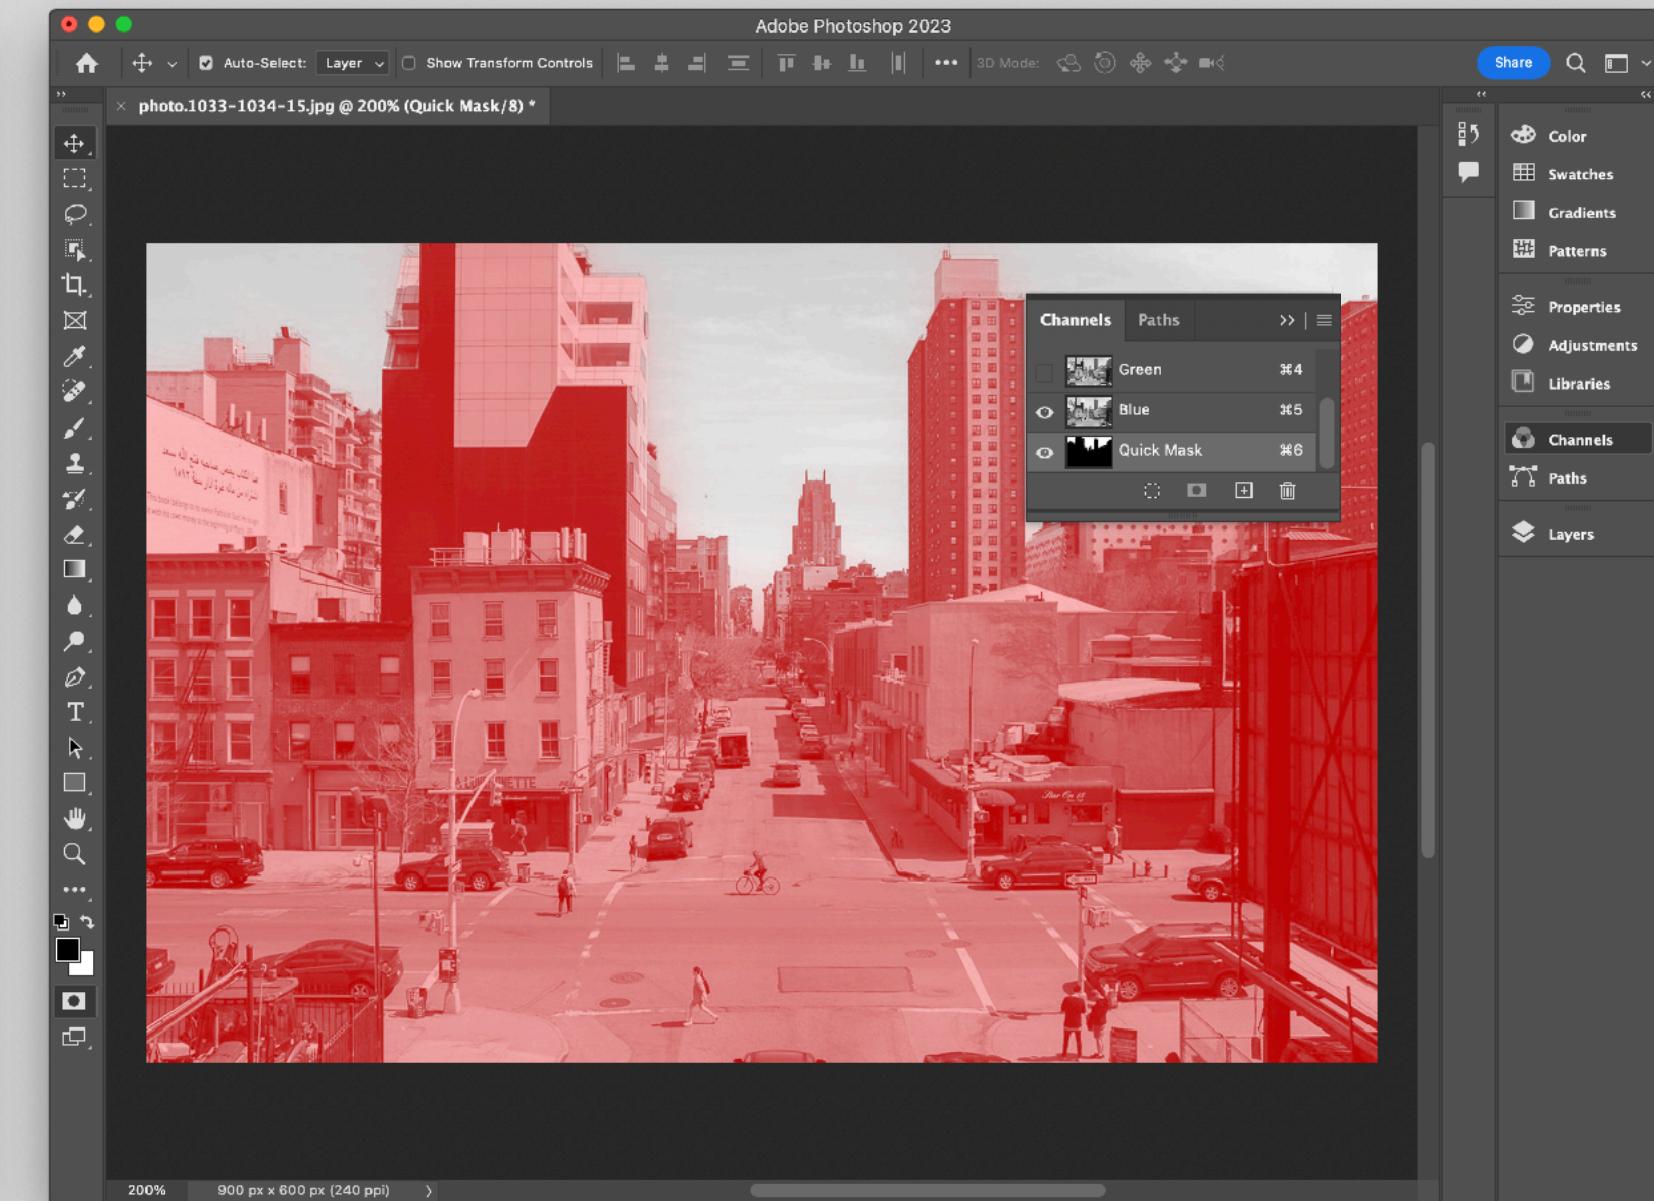

the mother of all synergies

selection (shown as “marching ants”)

edit selection as **mask**

toggle mask as **channel**

selection = mask = channel = grey scale image

scheduling
posts in Hugo

the challenge

assume we already have

a Markdown concept formats posts for a website

a Metadata concept that lets set title, author, etc (and refer as variables)

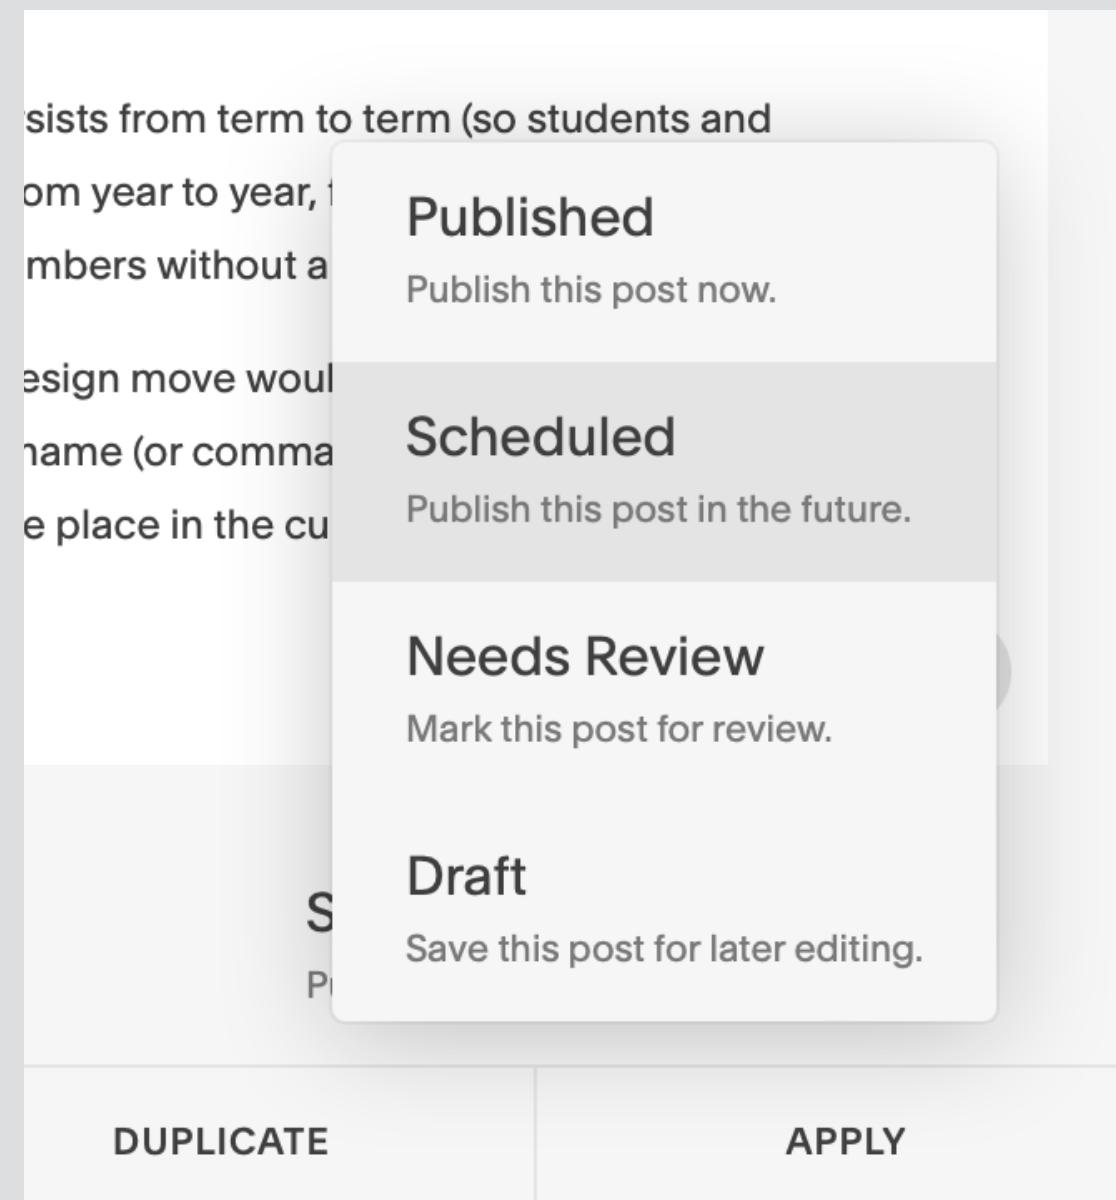

and now we want to schedule posts for future dates

what's the user interface?

static website builder doesn't have a UI; it's just a pile of files

a special JSON configuration file for scheduling?

a better solution: use the metadata date for scheduling

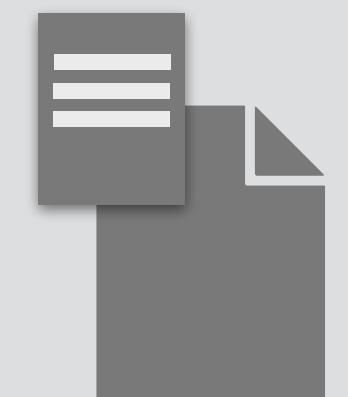

Squarespace: can schedule blog posts but not other pages, and can change pub date independently (only affects order)

A screenshot of a Hugo blog post page. The title is "The Class Number Dilemma". Below the title is a subtitle: "Who knew such a simple thing could be so challenging?". Underneath that is the publication date: "February 24, 2022 · 3 min · Daniel Jackson". Above the page content, there's a code block showing the YAML front matter for the post, which includes fields for author, title, date, description, and summary.

```
author: "Daniel Jackson"
title: "The Class Number Dilemma"
date: "2022-02-24"
description: "A Concept Example in Everyday Life"
summary: "Who knew such a simple thing could be so challenging?"
```

Hugo: any page can have date field to schedule, just set date in future

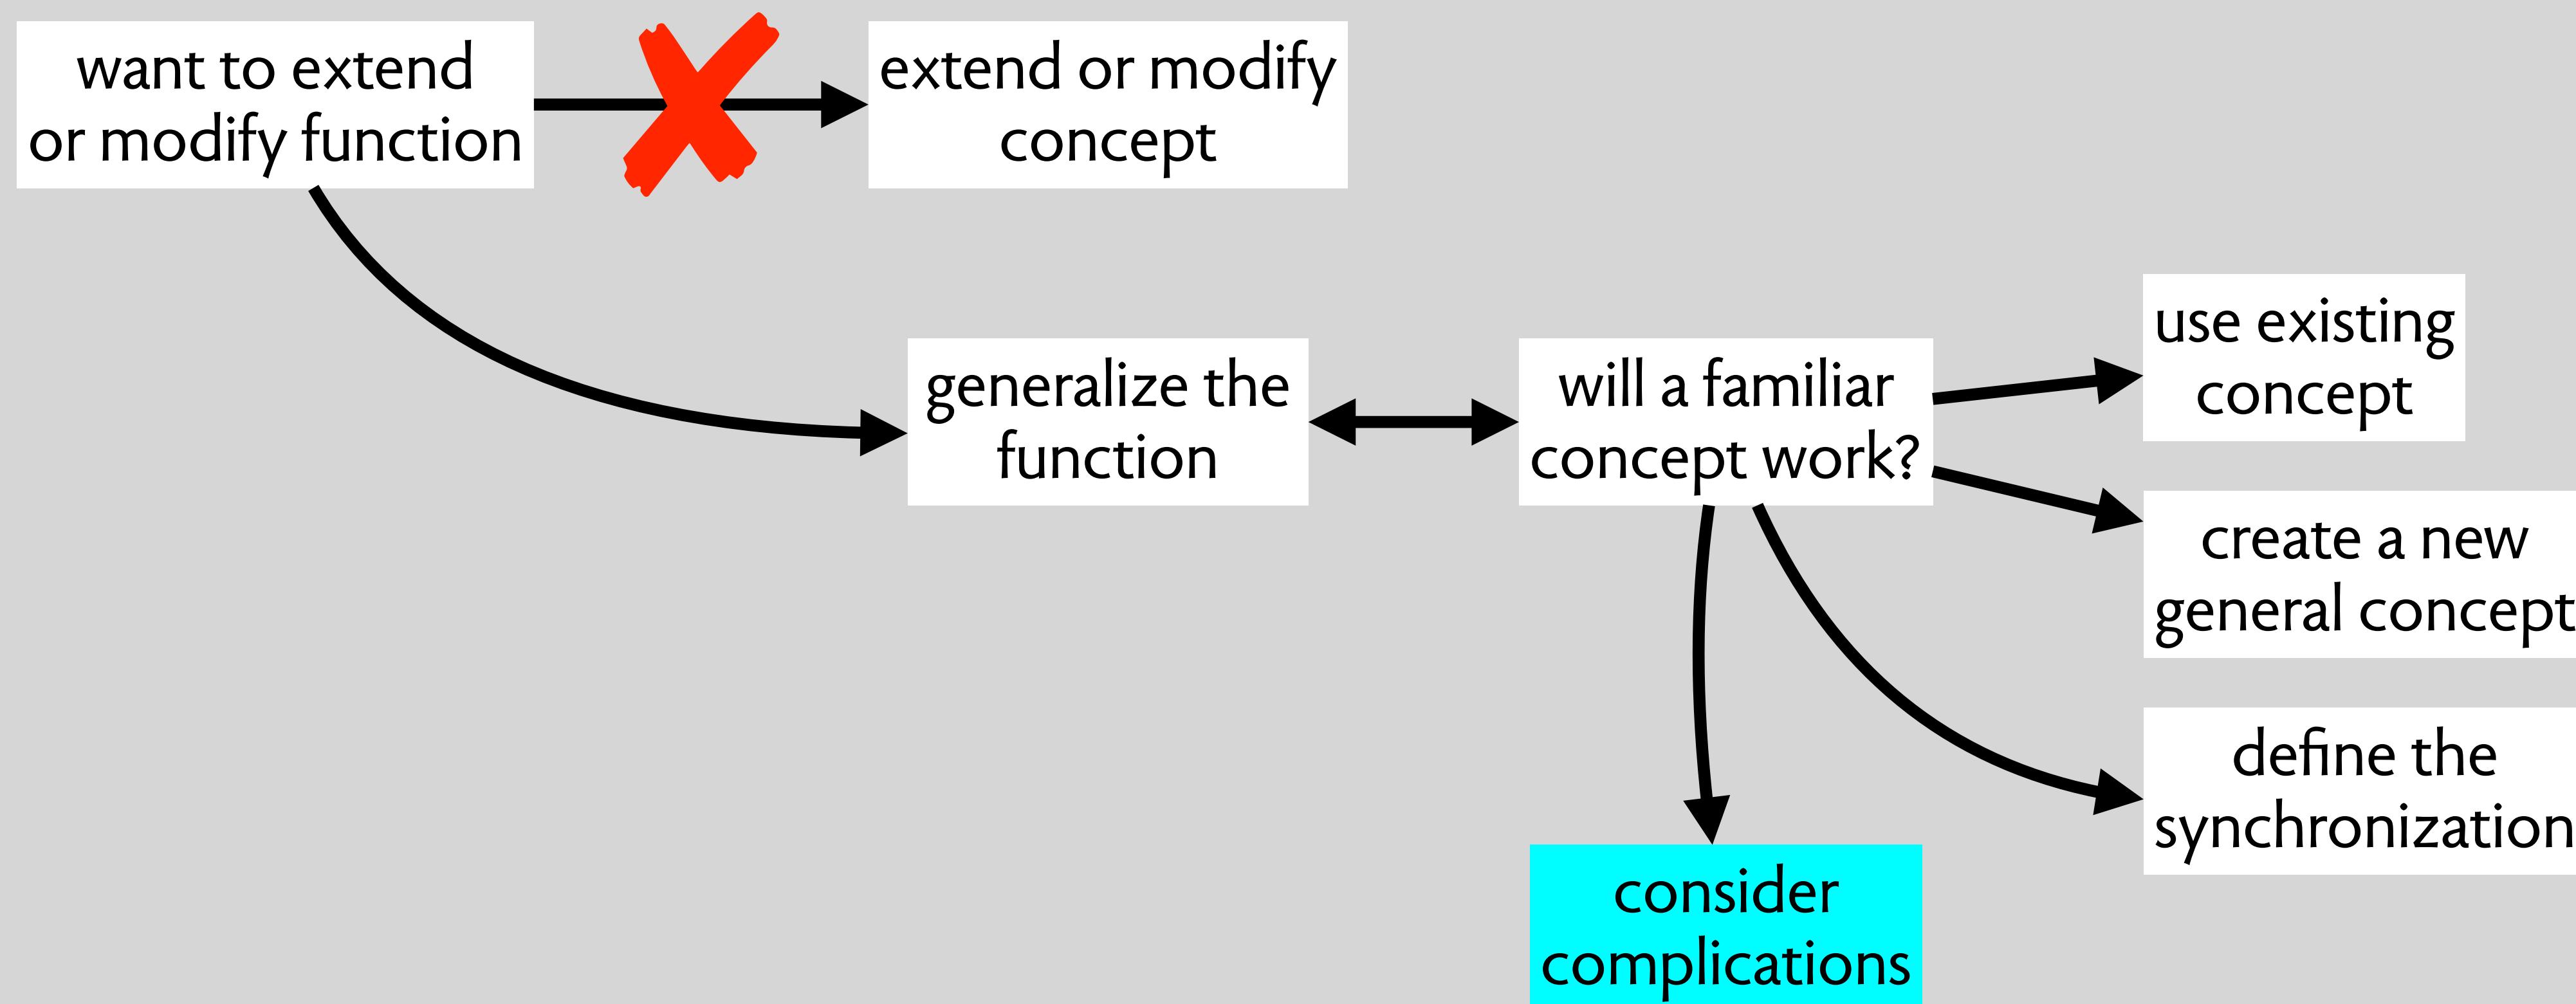

Metadata

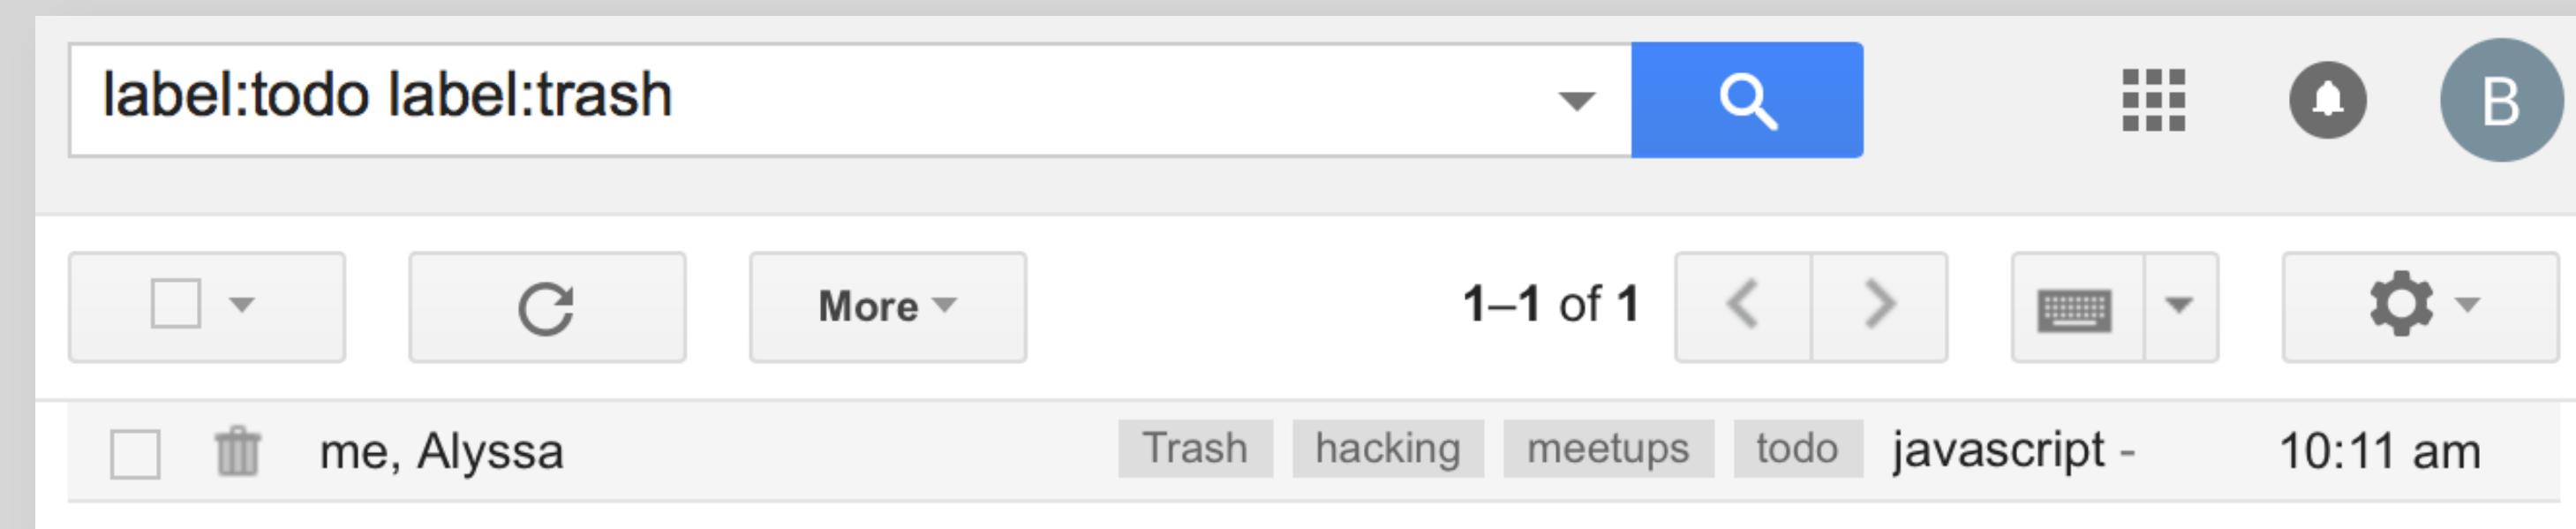

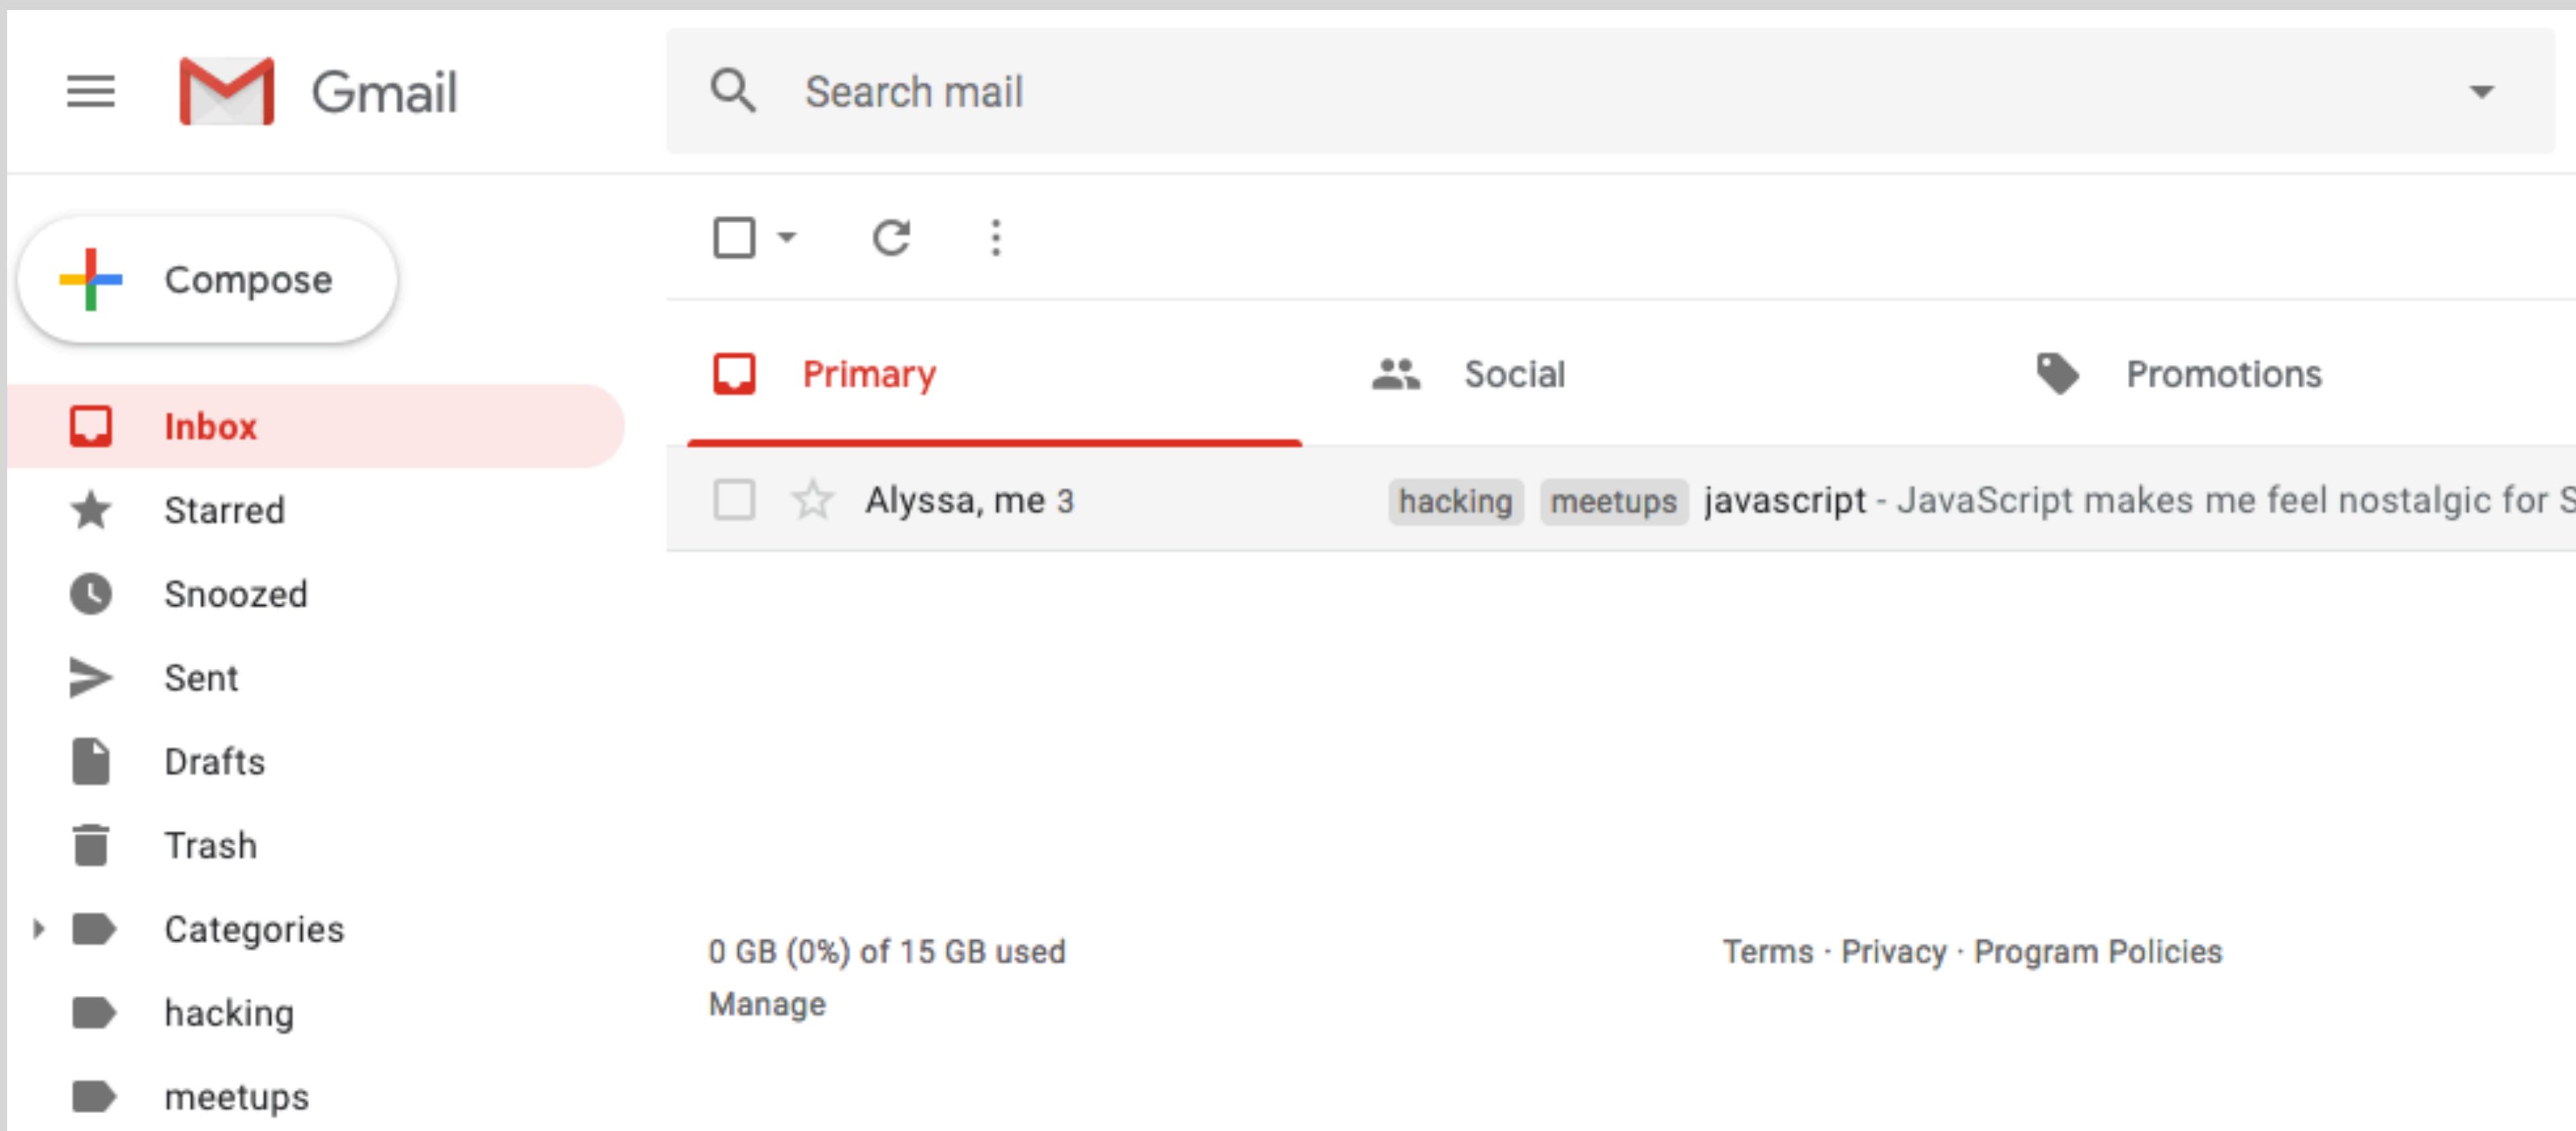

Schedule

there's no
free lunch

how to achieve familiarity & decoupling

Gmail complications

what new problems
might this design
result in?

a tricky aspect of this synchronization...

The image shows four sequential screenshots of a Gmail search interface, each with a callout box and arrow indicating a specific action or result:

- click on trash**: The first screenshot shows the "Empty Trash now" message. A callout box with an arrow points to the trash icon in the message list.
- filter on todo and trash**: The second screenshot shows a search bar with the query `label:todo label:trash`. A callout box with an arrow points to the search bar.
- filter on something else**: The third screenshot shows a search bar with the query `label:todo OR label:meetup`. A callout box with an arrow points to the search bar.
- filter on todo label**: The fourth screenshot shows a search bar with the query `label:todo`. A callout box with an arrow points to the search bar.

Screenshot 1: Empty Trash now

Empty Trash now (messages that have been in Trash more than 30 days will be automatically deleted)

me, Alyssa (13) hacking meetups todo javascript - Hello a 11:48 am

Andy from Google Updates Ben, welcome to your new Googl 9:01 am

Screenshot 2: Filter on todo and trash

label:todo label:trash

me, Alyssa Trash hacking meetups todo javascript - 10:11 am

Screenshot 3: Filter on something else

label:todo OR label:meetup

Some messages in Trash or Spam match your search. View messages.

Screenshot 4: Filter on todo label

label:todo

There are no conversations with this label.

moira mailing lists as access control lists

making the trash a folder

what new problems
might this design
result in?

exercise: the
QDM at Autodesk

what examples of the QDM in Autodesk products?

what power do they bring?

what additional complexities?

do you see opportunities to generalize existing concepts?

apply the QDM to improve on current conceptual structure?

takeaways

QDM examples

in social media app, want to allow downvote only if upvote

-> add **Karma** concept

in email client, want to let user see sent messages

-> add **Label** concept

in trash, want to allow sorting of files by date of deletion

-> add **Folder** concept, with "date added"

in photoshop, want to allow adjustment to be localized

-> generalize **Selection** concept from 0/1 to 0..1

in discussion forum, want only moderator to delete posts

-> add **RBAC** concept

in slide presentation app, want to break slides into sections

-> add **TreeOutline** concept (how about it, Powerpoint?)

keep concepts
familiar &
conventional

support more
functionality than
we needed

but sometimes
additional
complications

what's next

what does a set of concepts characterize?

a single product?

a family of products?

a domain?

how can structure such a set in a useful way?
